

RESETTING THE PUZZLE BOXES

Schrodinger's Cat

<https://idventure.de/en/cluebox-hints/#:~:text=The%20game%20can%20be%20reset,lock%20can%20be%20put%20back.>

The game can be reset by reassembling the box.

Please close and fix the lid and put the lock back (the 4 sliders have to be in the correct position).

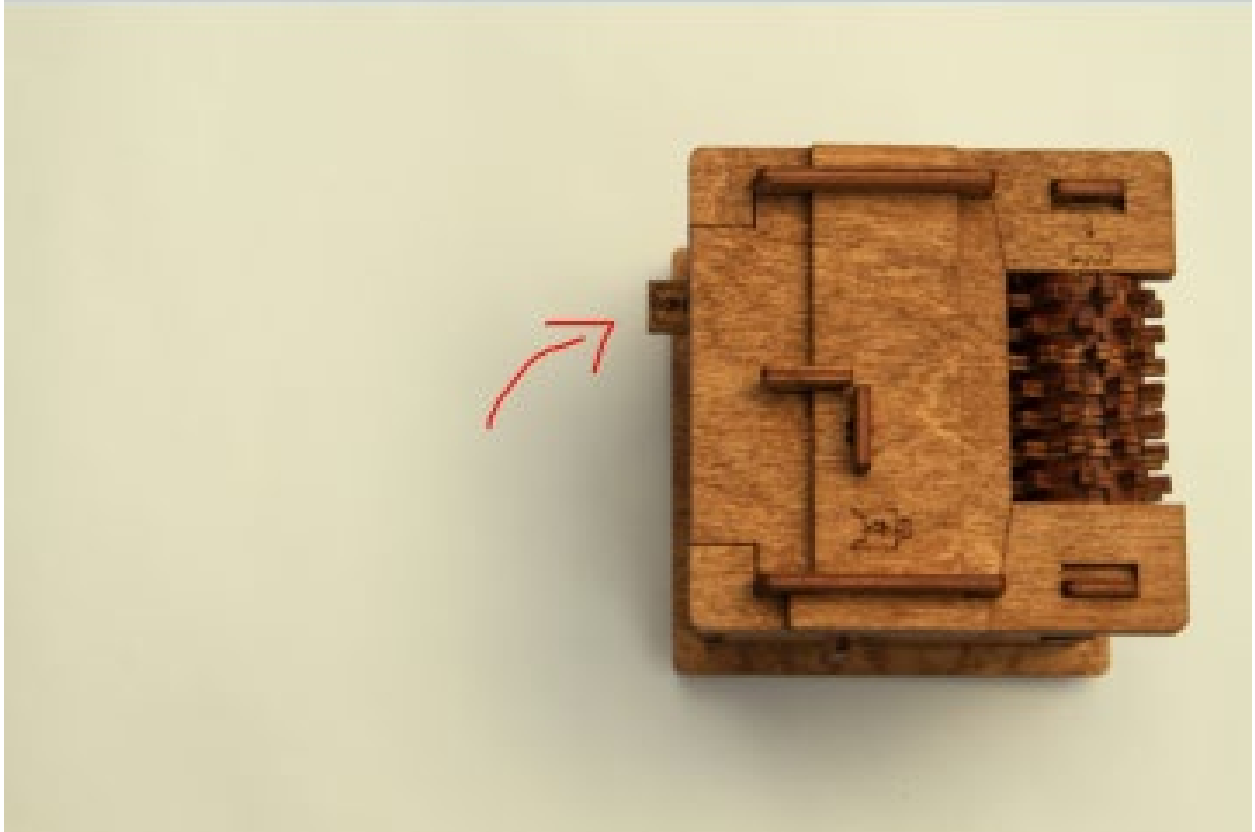

Then the symbols on the cryptographic gearwheels have to be recovered, so that the sideward lock can be put back.

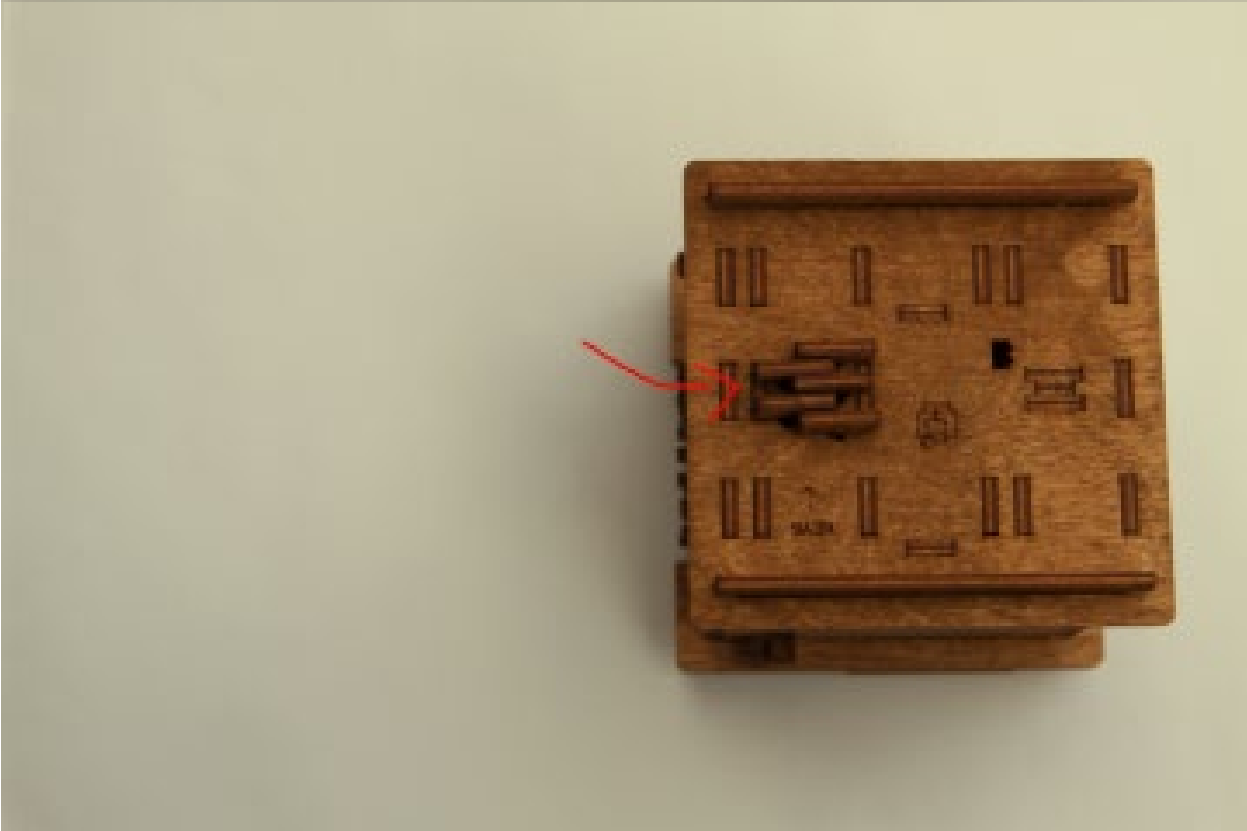

The hidden slider is still pulled out.

To hide it, you have to put the keys in the relevant keyholes. Then you can push it back into the box.

Lastly, put the keys back into the holes on the bottom surface and rotate them by 90 degrees.

Now the game is reset.

Nautilus

<https://idventure.de/en/cluebox3-hints/>

WARNING!!! Before you get to the box: at this moment you might have the big figure key stuck in the box. If this is the case – don't do anything about it until you read what to do. If you extracted the key at some point – don't put it in yet, until you read to do so.

Put the message in the capsule so that it fits in its narrow part. Check whether the ribs of the capsule are in the right position to close it. If not, use the keys to find and adjust the right position

Now close the capsule by adjusting the lid and rotating it clockwise.
After you did that – make sure to put all the ribs in the position “down” as shown

Insert the capsule into the box so that it fits completely.

Then insert the endings of the “petals” into corresponding slots you find on the capsule

IMPORTANT: From all the keys there are four keys, whose endings you will see on the side of the box with “petals”. Make sure you insert the keys so that they block the petals and are completely in. This is what it should look like in future, when all the keys will be in.

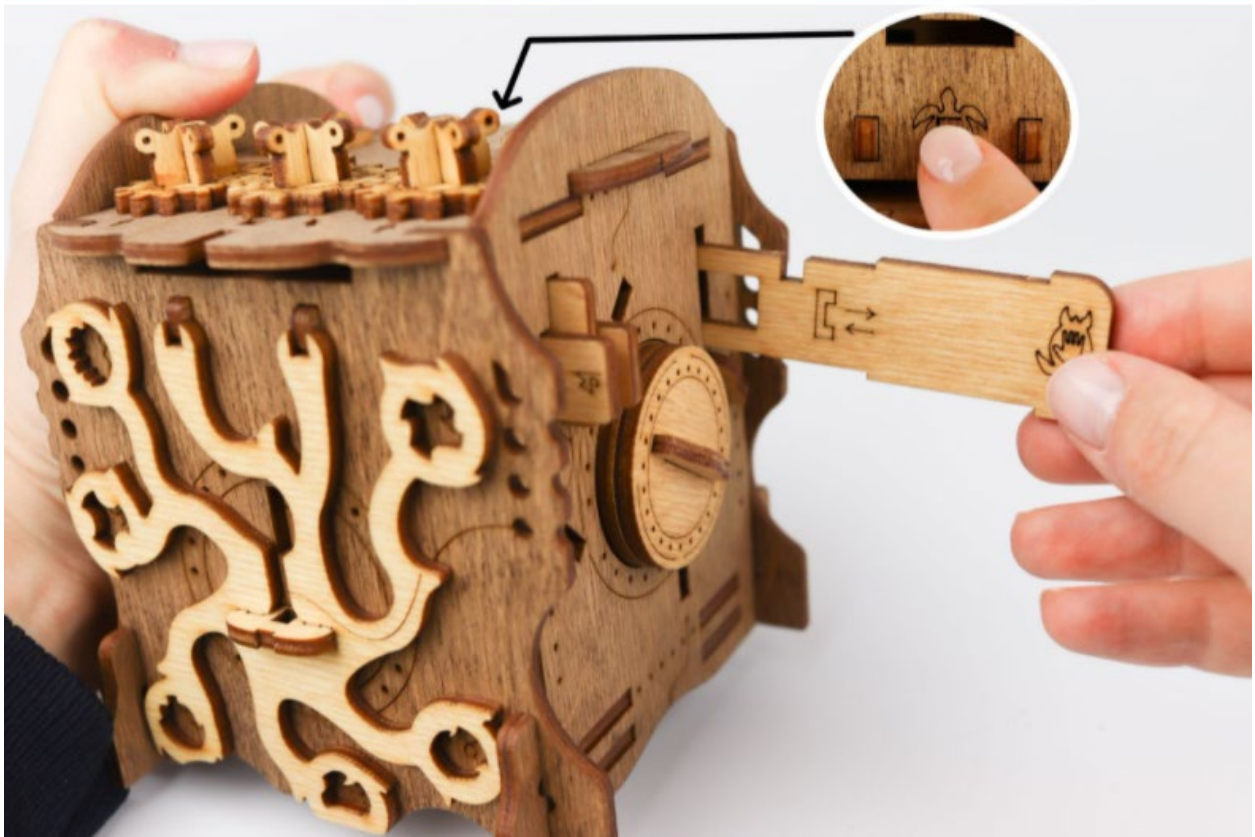

Take the big key with the tortoise and the narrow key with a big cavity (not with a small one!!!)

Holding the tortoise key pulled, insert the narrow key. Make sure the cavity on the narrow key looks face down.

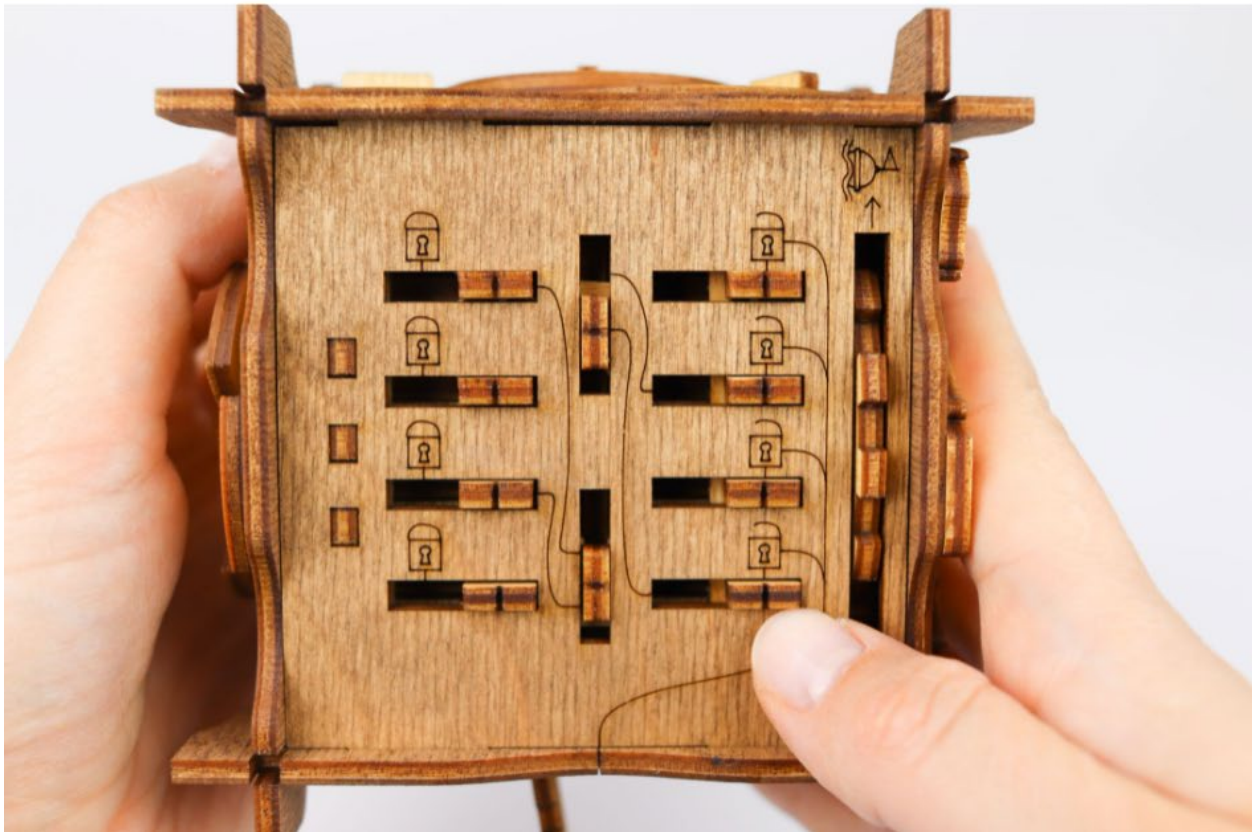

Holding the tortoise button pressed, insert the tortoise key as shown

Insert the wide key as shown (make sure the arrow is pointing down!). If you have problems with this step – check whether all the horizontal sliders on the bottom side of Nautilus Cluebox are in the opened position (i.e. on the

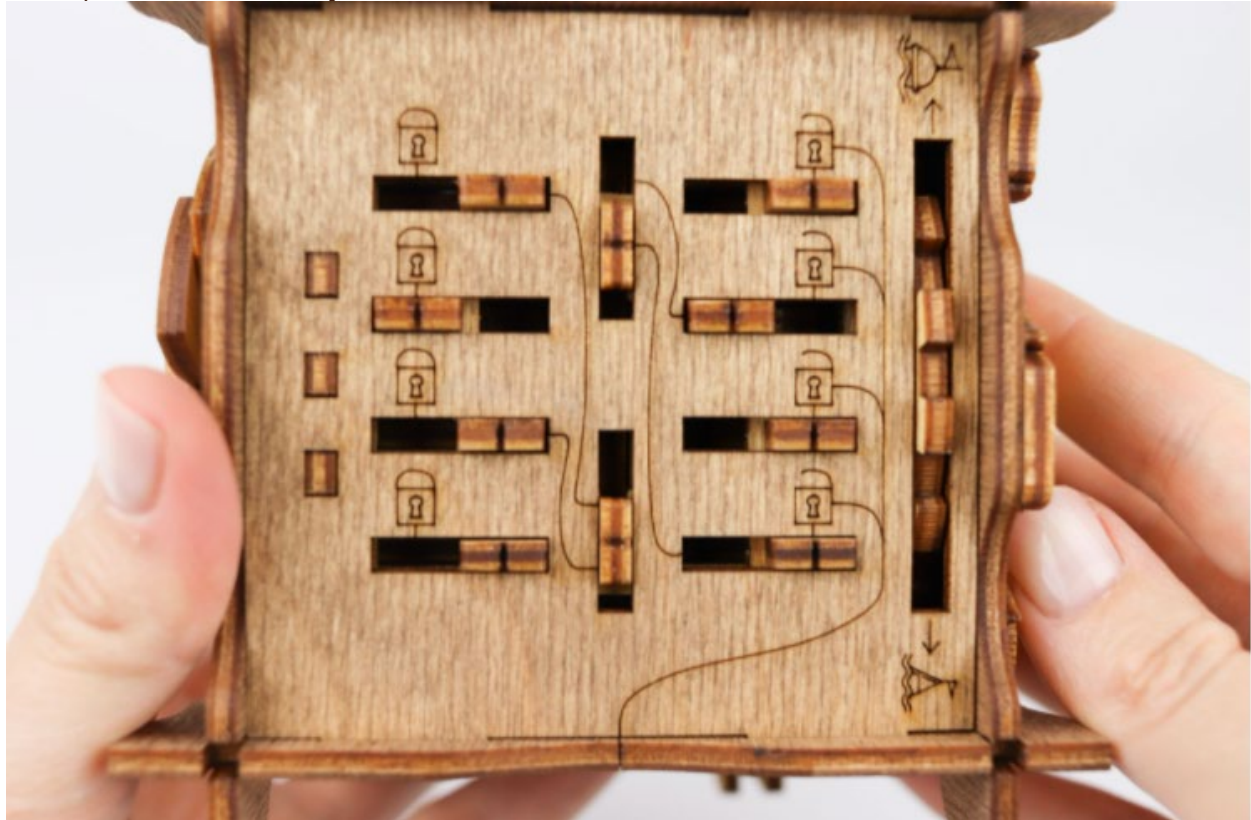

right)

Now we will bring the sliders into the initial position. Move the horizontal sliders to the left (with the help of the vertical slider) using the following sequence (exactly in this order):

4,1,3,2.

Now move the sliders 3,1,4 to the right (exactly in this order and again using the vertical slider). This should be your result.

Take these three elements, including the narrow key **with a small cavity**. Insert the narrow key (make sure the cavity looks face up!!!). Then adjust the ray fish.
*If the figure key is not in the box – insert it into the slot at this point.

Holding the big figure key pulled, insert the small curved key which blocks the ray fish.

To release the big figure key squeeze the parts with the arrows with your fingers and pull the key out.

Check whether the wheels near the ray fish are in the 2,4,5 position and insert the big figure key in the slot under these wheels.

Now you have to change the position of the wheels from 2,4,5 to any other combination to lock the key. We recommend setting the left and the right wheels on position 6.
IMPORTANT: make sure the middle wheel has its cavity looking forward in the end.

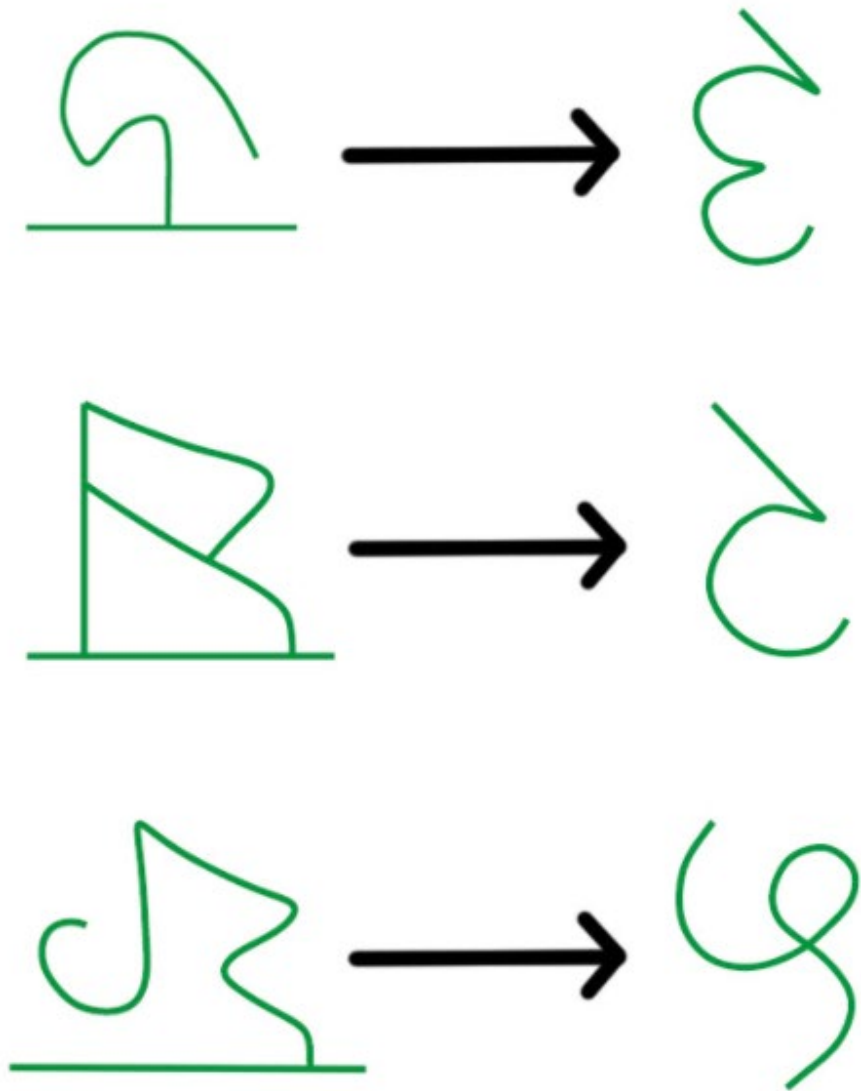

Insert the last narrow key with the cavity facing up, as shown.

Make sure the "hole" on the Octopus side is empty

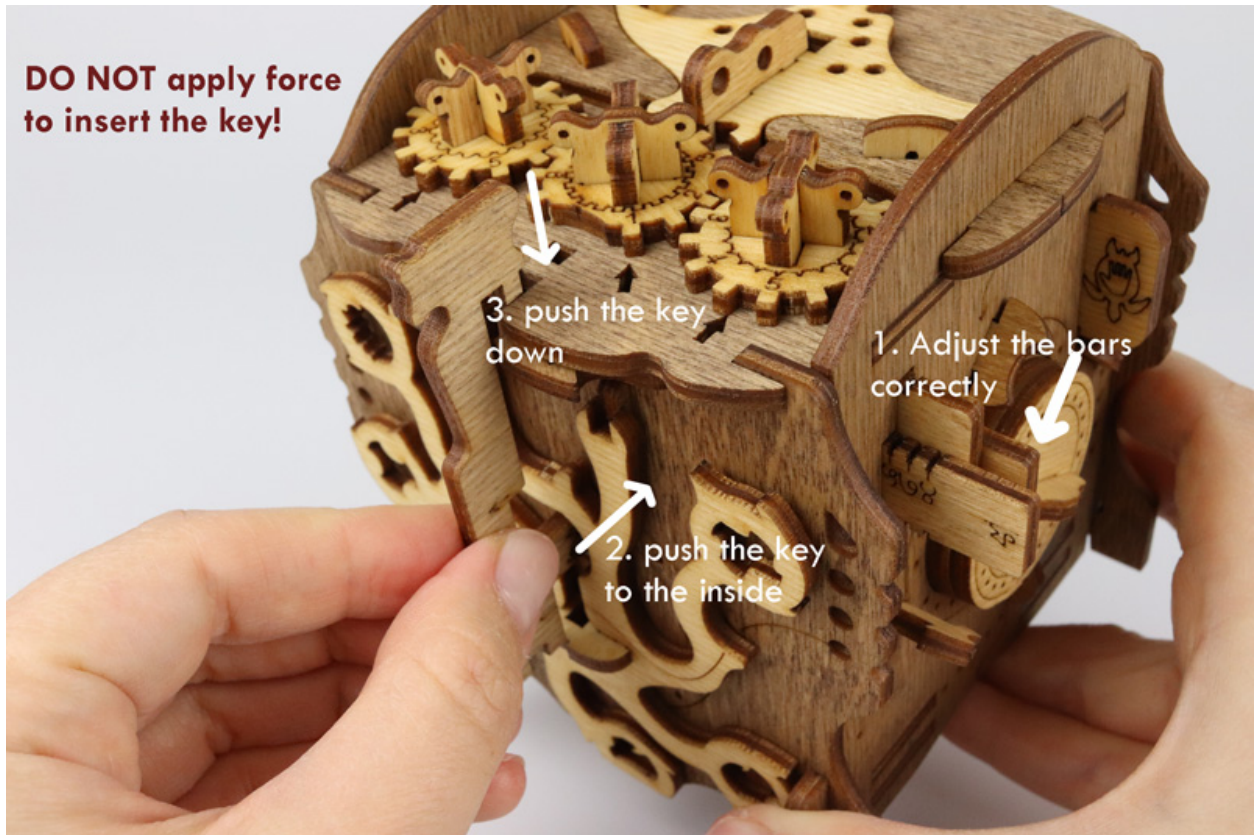

Adjust the moving bars according to the symbols

Insert the last key. First push the key horizontally then push it down. Then move the bars to lock the last keys

Warning! Do NOT apply force to insert the keys. As soon as you adjust the moving bars exactly – you will be able to insert the keys easily!

DO NOT apply force
to insert the key!

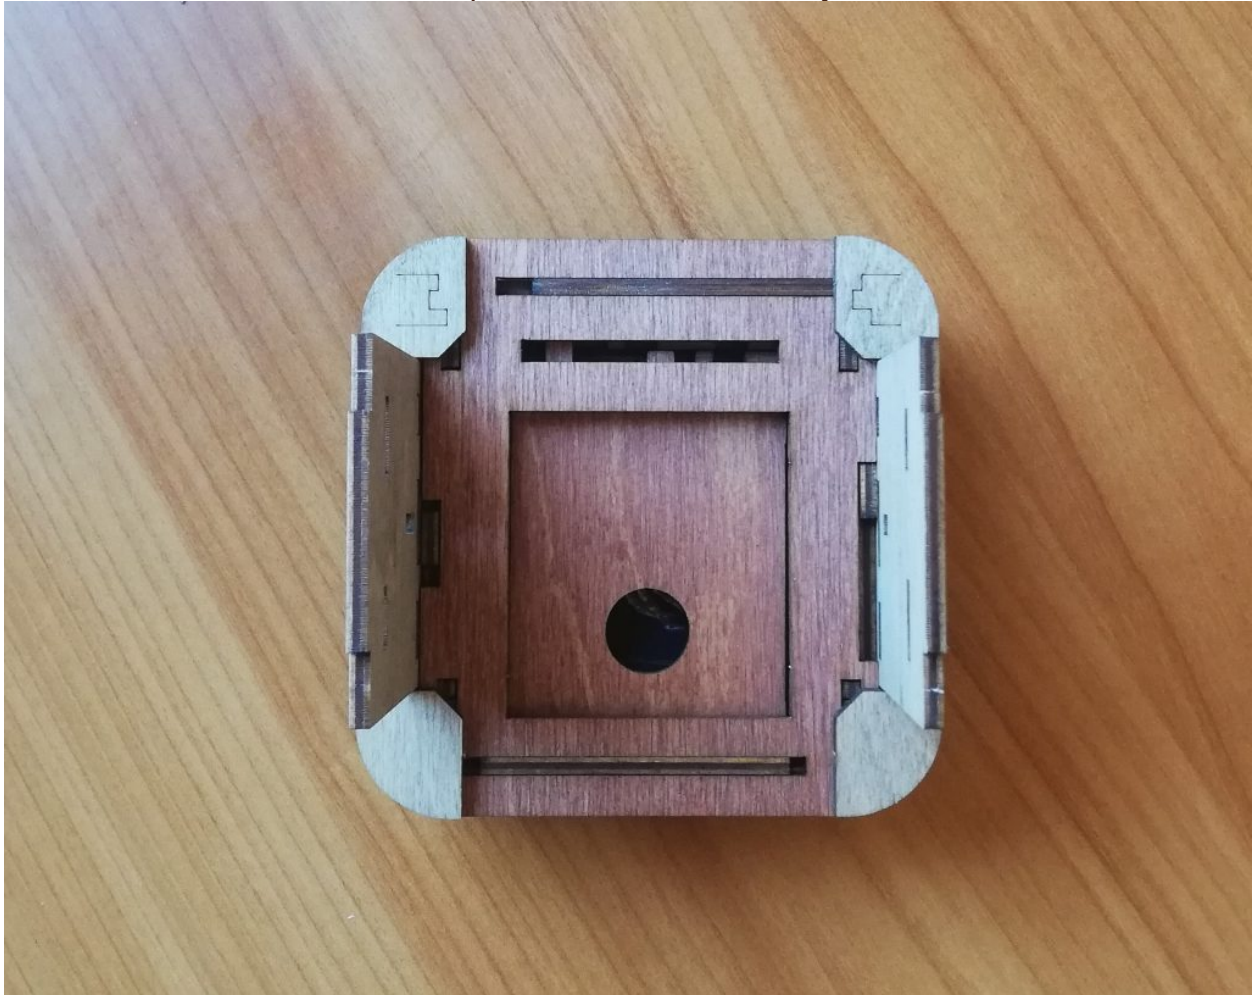

Ready! The box is now reset.

Davy Jone's Locker

<https://idventure.de/en/cluebox2-hints/>

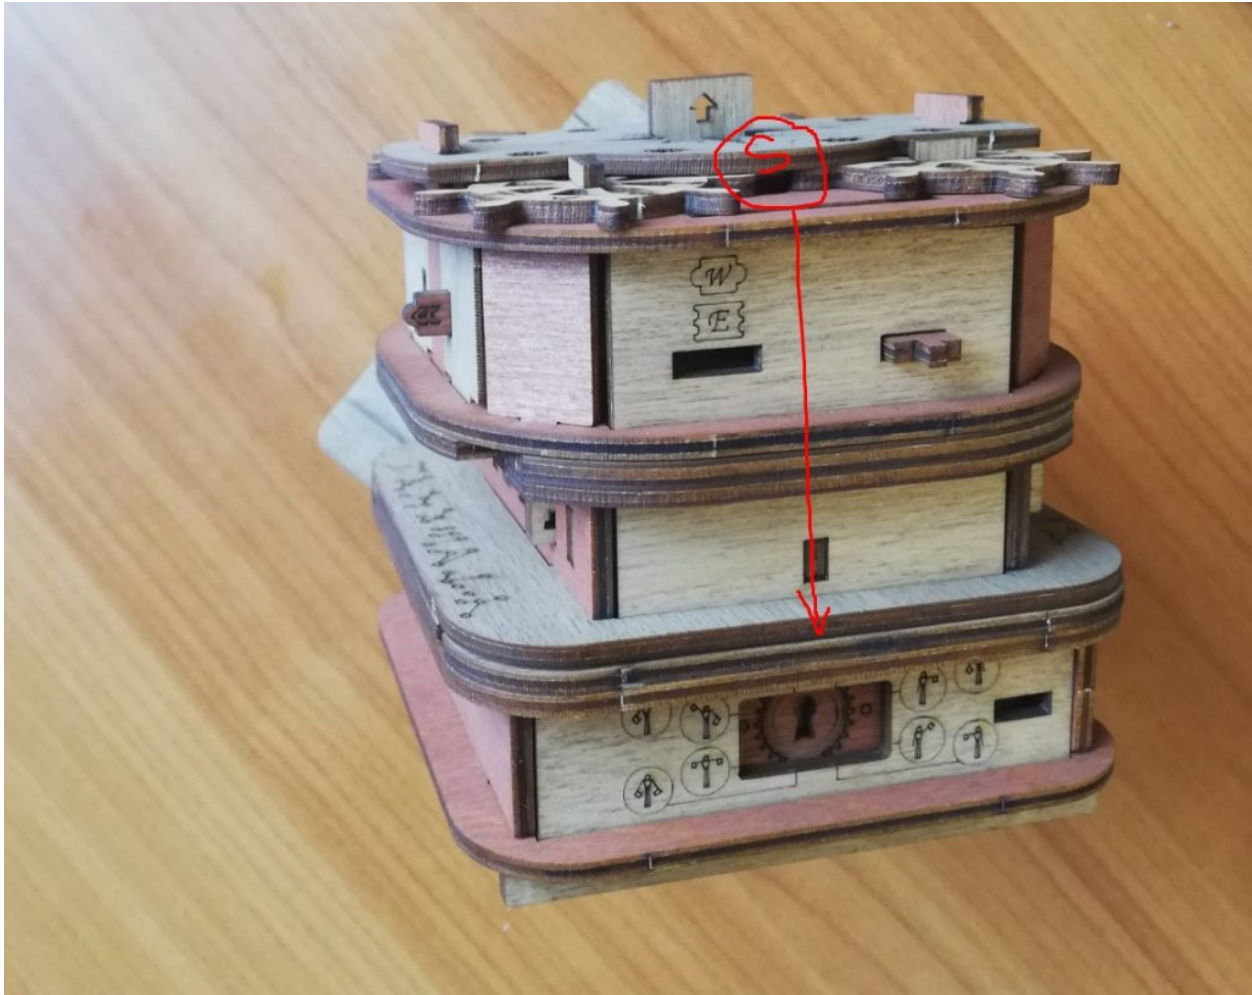

1. Insert the cover of the secret space and take out the keys

2. Place the middle tier of the box on the lower tier. Then set the arrow-keys near the stars in the correct combination. Finally, insert the locking key. **Pay attention to the direction of the key.**

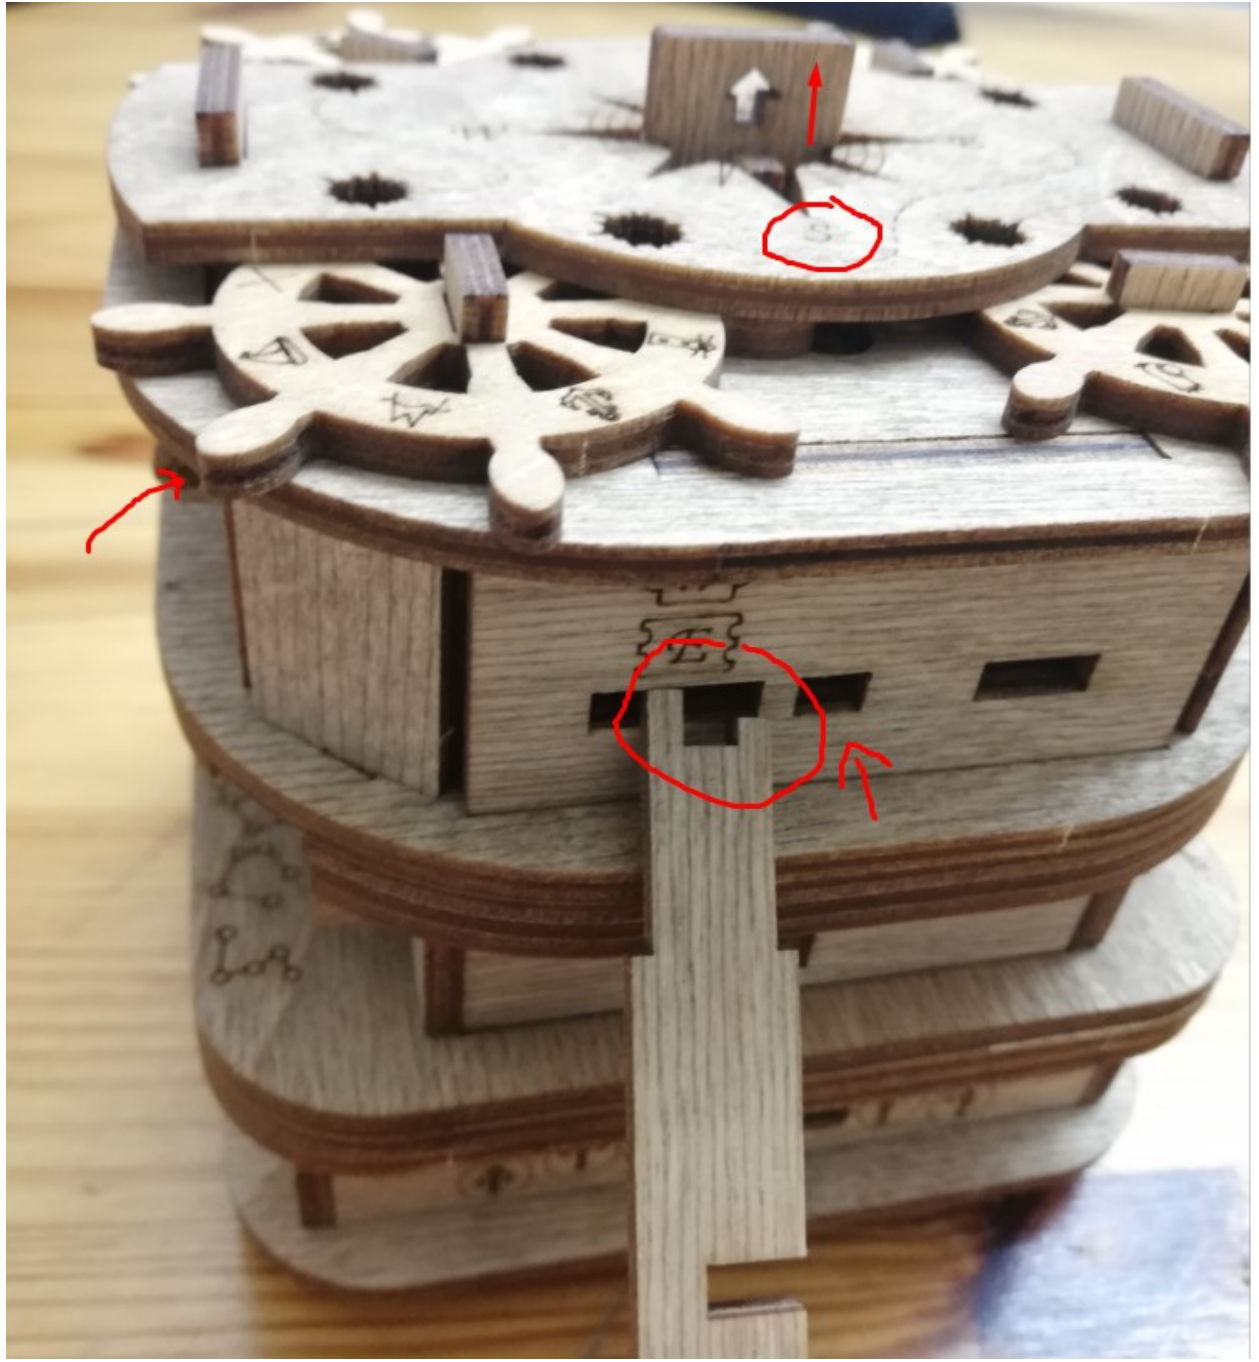

3. Place the upper tier of the box. Orient "South" to the direction of the hidden window.

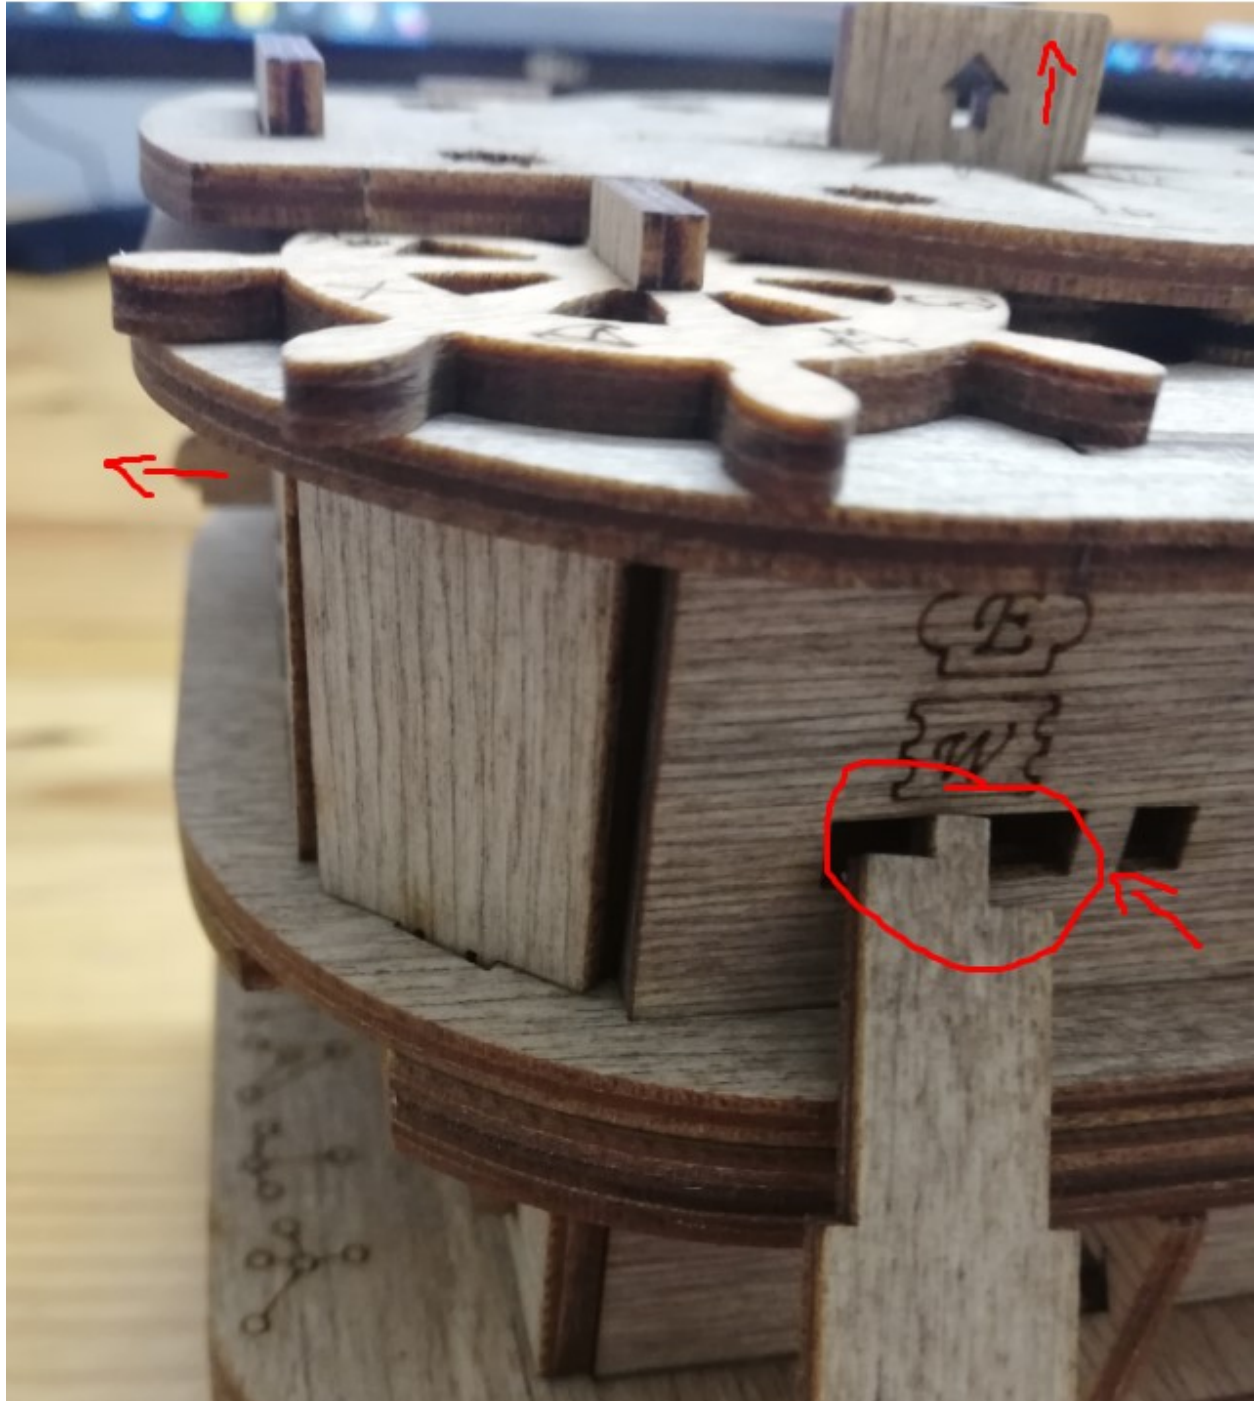

4. Repeat the actions similar to the process of opening the box

- Pull the upper key
- Push small buttons to (W)est / (E)ast as shown on the box
- Insert the keys **exactly as shown below**

(Standard version)

(Kickstarter version "Red")

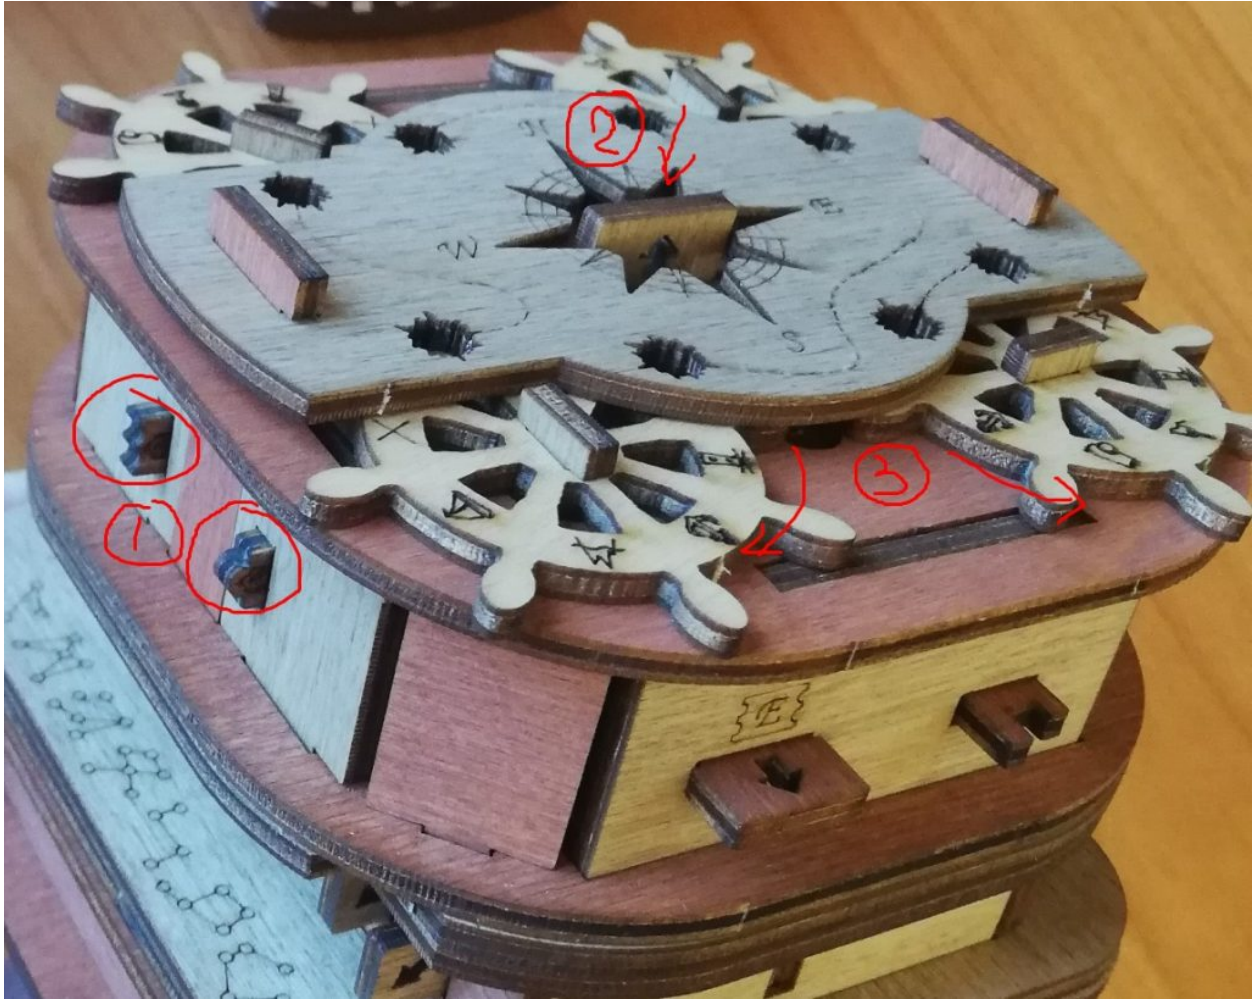

5. Lock the cover:

1. Place the small pins in the middle position
2. Push the upper key down
3. Rotate the steering wheels
4. Randomize the 8-Puzzle (the marine animals) on the bottom

This is the final step to reset and lock the box.

That's it! The puzzle box is now reset.
